

# Max of Two

**Difficulty** Easy

**Concepts** Mathematical Operators,  
Conditionals

Given the starting code of:

```
x = 1  
y = 2
```

Write a block of code that will print out the largest value.

Using the given values as an example, your code should print out `2`.

To verify your code is working properly, try and change the values of `x` and `y`.

As an additional challenge, print out `The values are identical.` if `x` and `y` have the same value.
